Robust Transfer Learning on SQuAD-v2 with RoBERTa

Abstract

We evaluate zero-shot question answering robustness using RoBERTa-large on SQuAD-v2. Our methodology achieves strong out-of-domain transfer performance.

Methodology and Experiments

4. Experimental Protocol and Dataset Filtering
To eliminate degenerate short queries, sentences with fewer than 15 tokens were omitted from the final evaluation pool. We configure learning rate lr=2e-5 with batch size 32 using adamw optimizer for 3 epochs.

5. Empirical Results
Our evaluated framework reached Macro-F1 of 84.2% ± 0.4% across filtered test targets.
